

Title: What is Sensory Processing?

(0:01) we have eight senses

(0:03) five you have probably heard of

(0:06) sight

(0:07) sound smell

(0:09) taste

(0:10) and touch

(0:11) and three that you may not be familiar

(0:13) with

(0:15) the vestibular sense

(0:16) sometimes known as the gravity or

(0:18) balance sense

(0:20) allows us to move smoothly

(0:22) it helps us with balance while we walk

(0:25) and run

(0:26) and to stay upright when we sit and

(0:28) stand proprioception is the sense of

(0:32) self-movement

(0:33) force and body position

(0:36) it is present in every muscle movement

(0:38) you have

(0:39) without proprioception you wouldn't be

(0:42) able to move without thinking about your

(0:44) next step

(0:45) [Music]

(0:46) interreception helps you understand and
(0:49) feel what's going on inside your body
(0:52) for example when you're hungry
(0:55) thirsty in pain or need the toilet
(1:01) imagine for each of our eight senses
(1:07) we have a cup
(1:08) and for us to feel regulated each cup
(1:11) needs to be full
(1:13) each time we get some sensory input for
(1:16) one of our senses it fills up the cup a
(1:19) little
(1:20) for each sense some of us have big cups
(1:23) and some of us have small cups
(1:26) imagine you have a small cup for sound
(1:29) it fills up quickly with a little noise
(1:32) and any more can feel overwhelming
(1:35) imagine you have a big cup for
(1:37) proprioception
(1:39) you will need lots of movement to feel
(1:41) regulated
(1:43) understanding someone's sensory profile
(1:45) is really important in order to know
(1:48) what they need to feel learn and perform
(1:51) at their best
