

Title: What is ADHD?

(0:06) hi I'm max Davey NHD specialist and
(0:10) person with ADHD and I wanted to make
(0:12) this quick video just to just explain
(0:15) what I think ADHD is for people maybe
(0:19) older children or adults who are
(0:20) thinking about whether it fits with them
(0:22) and also whether maybe have been told
(0:25) you have ADHD and you weren't really
(0:27) sure what the person meant I'm going to
(0:29) start from two facts one is that
(0:33) everyone's brain is different and that's
(0:35) wonderful the second is that you are not
(0:38) your brain and this second one needs a
(0:41) bit more getting your head round really
(0:43) but we all walk around in our brains and
(0:45) they're not completely under our control
(0:47) so our attention could wander or we
(0:50) could find ourselves doing or thinking
(0:52) something without quite realizing it and
(0:54) that's true of everyone but especially
(0:56) true of people with ADHD one of the most
(0:59) popular analogies about ADHD is that
(1:02) having an ADHD brain is like having a
(1:03) car with a really powerful engine but

(1:07) with bicycle brakes and I often add in a
(1:10) bicycle handlebar so is very fast and
(1:12) speedy and powerful but the stick the
(1:15) steering and the stopping aren't so good
(1:17) and that pathologist's analogy is fine
(1:20) but for me we're not a car is not a
(1:24) living organism and where our brains are
(1:25) living organisms and actually they have
(1:27) a kind of minds of minds of their own in
(1:29) a funny way so I think of more of riding
(1:32) around on a dinosaur which is a nice
(1:35) image because we all know different
(1:37) sorts of dinosaur we've all learned
(1:38) about them and that goes back to the
(1:40) different brains think so some people's
(1:42) brains are herbivores they're very
(1:45) steady and sedate and meticulous and all
(1:49) those things and that's fine it's just
(1:51) not us
(1:52) the athd brain is ravenous it wants
(1:56) stimulation all the time it wants
(1:57) emotions it one's always to be moving
(2:00) around because the movement is a
(2:01) constellation
(2:02) so this ravenous brain I call a t-rex
(2:04) brain a Tyrannosaurus Rex brain it's a

(2:07) great brain to have in lots of ways but

(2:10) sometimes it gets us into trouble and in

(2:11) the neck

(2:12) video I'll talk about why it can get us

(2:15) into trouble and when we start to think

(2:18) about diagnosis

(2:27) you
